

Tracking the Ten Thousand

Extended Commentary

This document contains extended commentary on each line or lines in Xenophon's Anabasis that corresponds to movement of the Greeks, or the so-called Ten Thousand. It is meant to be consulted in conjunction with the text and/or the digital maps.

This is part of an ongoing undergraduate research project at Furman University.

Book 1

(1.2.5) Sardis to Maeander river(?):

- Where exactly the Ten Thousand crossed the Maeander cannot be precisely verified in the same way the location of Sardis can (hence the “(?”), however it is almost certainly as the reconstruction shows, as the distances line up very well.
- As with the proceeding segment, this segment does not follow the standard 5 parasangs a day march pattern, which could indicate haste on Cyrus’ part, or due to the fact that travel is easier since this is Cyrus’ domain.

(1.2.6) Maeander river(?) to Colossae:

- This segment pushes the lower end of what would be expected of an 8 parasang march (the reconstruction is closer to 7), but the terrain and data are so straightforward that this is not worrying. This could be due to the variable value of a parasang, the lack of modern understanding on what precisely a parasang meant, the march not taking a full 8 parasangs, or other reasons.
- As with the preceding and proceeding segment, this does not follow the standard 5 parasangs a day march pattern, which could indicate haste on Cyrus’ part.

(1.2.7) Colossae to Celaenae:

- This segment both does not follow the typical 5 parasangs a day rate (to a notable extent, reporting 3 day's march to cover what should take 4) and the reconstructed route has a lower distance than what 20 parasangs ought to be. However, both Colossae and Celaenae are well-established and there is little room between them for route variation, so the reason for this discrepancy is unclear.

(1.2.10) Celaenae to Peltae(?):

- Peltae does not have a corresponding Pleiades entry and is generally considered unlocated. Its ambiguous location begins an infamous string of ambiguous locations in Book 1, making reconstruction based on measurement challenging, though still useful. Xenophon's measurements are straightforward in this section, and it is grounded by being in reference to the identified location of Celaenae. While there are a few different directions the Ten Thousand could physically travel from Celaenae, northwest is most likely when considering the proceeding ambiguous cities, and their most likely locations in relation to the next solidly identified site: Tyriaeum. This means the reconstructed location of Peltae is just south of modern Gürpınar.

(1.2.14) Thymbrium(?) to Tyriaeum:

- Since Tyriaeum as a site is located (compared to Thymbrium, with no location), working backwards from it to reconstruct the location of Thymbrium is better than working through the text chronologically, since it helps minimize compounding uncertainty. Xenophon's measurements in this section are straightforward, as is the terrain, making the reconstruction of Thymbrium in between modern Gölçayır and Ulupınar
 - This means that, if the so-called Spring of Midas still exists that Xenophon reports, it may correspond to the Degirmen Dere stream in Değirmenköy, Konya

(1.2.11) Peltae(?) to Ceramon-agora(?):

- One of the more infamous unlocated sites mentioned by Xenophon. Based on the very long proceeding measurement given by Xenophon (from Ceramon-agora to Caystrupedion), the direction that makes the most sense would be northwest, though the reason for that is unclear. This is supported by Xenophon's remark that Ceramon-agora was the last Phrygian city on the way to Mysia, which, regardless of the veracity, does indicate a north-northwestern direction.
- This reconstructed point for Ceramon-agora lies between the modern villages of Eskişaray and Güre in the Uşak District. The Karun Treasure (so-called "treasures of Croesus"), a collection of Lydian treasures found in the area around Güre, supports habitation of this area in antiquity.
 - This reconstruction does disagree with the Pleiades entry that notes it is somewhere in the plain of the Cayster River, but that plain is in the next prominent valley south of Sardis, which is a very unlikely distance to cover and destination. While the intent for why Cyrus travels to Ceramon-agora is uncertain, it would have been much easier to reach from Sardis. Alternatively, if this slight backtrack was somehow a cautious reaction to Artaxerxes II, perhaps to throw

him off their scent, then it would make more sense for Cyrus to return to his stronghold in Sardis if he was willing to travel so far.

(1.2.11) Ceramon-agora(?) to Caystru-pedion(?):

- This segment is one of the most contested in the *Anabasis* due to its ambiguous start and end points, its distance, and its discrepancy with the standard 5 parasangs/day march rate. The 'sandwich technique' of working forwards from Celaenae and working backwards from Tyriaeum was, in addition as a way to minimize compounding distortion, primarily aimed at addressing this segment by trying to make what came before and after it as reliable as possible.
- And, with this framework, this segment of the route ended up fitting almost perfectly. A distance of 30 parasangs (~162km) works remarkably well with the terrain between Ceramon-agora (reconstructed near Eskisaray) and Caystru-pedion (reconstructed south of Çobanlar).
 - This would presumably make Xenophon's Caystru River the Akar(?) Cayi, which does originate in the valley of the Pleiades reference point for the Kaystros (before assumed to be an entry for Xenophon's Caystru), though this point is further east.
 - One question this raises is that Çobanlar is attested to in Ancient Greek (Αναβωπα), so it is unclear why Xenophon would not refer to this city, which would seemingly be more popular. On the other hand, absence of a mention does also necessarily mean that this reconstructed end point for Caystru-pedion is wrong, as by no means is Xenophon obliged to mention every major town or settlement nearby their route. Indeed this is a military account, not a geographical one. Furthermore, Çobanlar is on the north side of a lake that apparently existed in antiquity (according to the AWMC data for inland water, which is referencing the Barrington Atlas), while this reconstructed Caystru-pedion is to the south. Again, this reconstruction does not place nor assert that Caystru-pedion was related to Αναβωπα, merely noting that they were close to one another. This assumption that Xenophon ought to have mentioned Αναβωπα is implicitly influenced by our modern goals to discover where it was. Xenophon was under no obligation to "prove" the existence or relevance of Caystru-pedion to us or his readers.

(1.2.13) Caystru-pedion(?) to Thymbrium(?):

- This segment was first reconstructed working backwards from the reconstructed Thymbrium, itself reconstructed working backwards from Tyriaeum, as this 'sandwich technique' (working backwards while simultaneously working forwards from Celaenae) helps minimize compounding uncertainty. Other than that, the segment itself is straightforward and largely fits the terrain, narrative, and surrounding segments.

(1.2.19) Tyriaeum to Iconium:

- This route does not follow the standard 5 parasangs/day rate. Xenophon's parasang measurements are also the better part of a day longer than the reconstructed route (20

parasangs = ~108km; route = ~85km = ~15.7 parasangs). The reconstructed route actually corroborates a 3 day journey, as that would typically be 15 parasangs, so it is unclear why Xenophon reports 20. Despite this inconsistency, Iconium is very well established and Tyriaeum, based on both gazetteer and contextual evidence, is too, making this reconstruction rather straightforward.

(1.2.19) Iconium to 1.2.20 stopping point(?):

- This approach to the Taurus, as well as the proceeding segments that detail the march into Cilicia itself, are contested by scholars. Part of this is due to Epyaxa's departure from Cyrus, where she and Menon are reported to have taken the shortest route into Cilicia, though what that is or where this departure took place is unrecorded. Multiple interpretations have been offered up, most prominently a departure south near modern Karaman or near modern Ayranci, however these have also been impacted by the debate over the location of Dana in the 20th c.
- In agreement with Williams, 1996, Epyaxa likely took a route southeast towards Mersin, likely departing near Ayranci. This is in rough accord with Xenophon's measurements (which do not follow the typical 5 parasangs/day here), albeit following a more circuitous route. A direct line from Iconium to Ayranci does not coincide with Xenophon's measurements, but there are a couple reasons why a circuitous route better reflects Xenophon's narrative: Most prominently, Xenophon notes that Cyrus let the Greeks plunder the land, so that may have slowed the progression somewhat; in representing this on a map, two options are to either reconstruct a direct route—which would not as effectively communicate the degree of ambiguity and interpretation in this segment to a reader without reading this commentary—or to reconstruct a more circuitous route, which a reader would hopefully be more likely to investigate. The second reason is water availability, which Williams and others have noted is a challenge in a northerly route versus a southerly one.

(1.2.20): 1.2.20 stopping point(?) to Dana:

- The Pleiades reference point here is based on Williams (1996) who convincingly argues against the traditional identification of Dana with Tyanna, instead favoring a site near Zeive, opposite modern Porsuk. Supporting this identification are his analyses of different routes to this Dana, which have been supported this far through reconstruction, and proceeding through the Taurus mountains.

(1.2.23): Dana to Tarsus:

- This section is a particular challenge to reconstruct. As mentioned with the previous segment, the identification of Dana with Zeive as argued by Williams (1996) has since been adopted as the scholarly consensus. However, in that same paper Williams argues that a route through the Cilician Gates, historically one of the most common routes through the area, is unlikely for a number of reasons. These range from strategic and military concerns to the language of the account to Xenophon failing to mention the Gates at all, as they were generally a famous and noteworthy landmark prior to being dynamited out for the modern highway. Moreover, Williams's location of Dana is

predicated on the alternate routes he proposes. These two alternate proposals, however, have not been adopted by the scholarly community like his identification of Dana has. Brennan and Thomas (2021) most recently map Xenophon through the Cilician Gates, with little mention to the controversy.

- Of the two alternatives Williams proposes, this study did not find either of them to line up quite so well with the distances in the text. Both are also hard to reconcile with the terrain, especially Xenophon's description of descending from the mountains to a plain, and then through that plain marching to Tarsus
- Speaking of, Xenophon's language is worthy of emphasis here. In the text he says "After descending he marched through this plain four stages, twenty-five parasangs, to Tarsus..." The Greek work used for descending (καταβὰς) is an aorist active participle, meaning it is describing a completed action in the past. Therefore, Williams's tentative speculation that perhaps Xenophon meant to include the descent from the mountains AND the march through the plain all in that twenty-five parasangs does not hold up, as it is hard to believe Xenophon, a trained orator and rhetorician whose Attic prose have been studied for millennia and who throughout the text shows remarkable care in the language he employs, would misuse the aorist tense here. Thus, it would seem non-negotiable that the Ten Thousand marched entirely through the Cilician plain for those 25 parasangs. However, in measuring 25 parasangs out, that is about as long as Cilician plain in its entirety, meaning one would have to march in the opposite direction from Syria for that to make sense. This, naturally, is not the journey Xenophon describes
- So that leaves this study in a bit of a dilemma. While an unsatisfying answer in light of the problems mentioned, this study has opted to agree with Brennan and Thomas (2021) and map Xenophon through the Cilician Gates. However, I also would like to emphasize that this solution is temporary. I suspect there may be another circuitous route northward through these mountains that some GIS analyses could illuminate as a potential fit, however due to current time constraints I have not been able to investigate this further.

(1.4.1): Tarsus to Psarus crossing(?)

- Xenophon's measurements are longer than the actual distance, but the terrain from Tarsus to the Psarus is so straightforward the reason for the discrepancy is unclear.

(1.4.1) Psarus crossing(?) to Pyramus crossing(?):

- Xenophon's measurements line up exactly with the terrain and reconstruction.

(1.4.1) Pyramus crossing(?) to Issus:

- This segment does not follow the standard 5 parasangs/day rate, which is especially odd because if it did then this measurement would line up almost perfectly. It is unclear why Xenophon gives an additional 5 parasangs, and this reconstruction cannot adequately account for it.

(1.4.4) Issus to the Syrian Gates:

- This segment is slightly short of a full day's march, but, given that the values are close, the difficult terrain in antiquity, and the fact that Cyrus was expecting to fight once

reaching the Gates, this is not cause for concern. These gates are not to be confused with the Cilician Gates (Gülek Pass) nor the Syrian Gates (Belen Pass). These are gates between Syria and Cilicia near modern Sariseki, İskenderun. There is evidence that the ruins commonly called Jonas' Pillar are actually a remnant of these gates. As such, this reconstruction places them right at that site, not the Pleiades reference point, though it's important to note that this wall stretched from the ocean to the mountains, so the points are not mutually exclusive. Xenophon's Carsus River is still ambiguous, as there are a number of rivers in this region, and it's likely that this coastline has shifted dramatically due to alluvial deposits. The river, therefore, may have changed course or dried up.

(1.4.6) Syrian Gates to Myriandus:

- This segment is only about half a day's march from the Cilicia-Syria Gates, but since Myriandus is well identified, this discrepancy is unclear. It may be due to the seemingly more difficult terrain in antiquity, or it could be that this march was intentionally shorter (as Cyrus stayed in Myriandus for a while), and Xenophon doesn't relate that part.

(1.4.9) Myriandus to the Chalus river(?):

- Though ambiguous, this reconstruction follows the Barrington/Pleiades data that aligns with other sources that identifies the Chalus as the Queiq, which flows through Aleppo. Other sources, such as Farrel 1961, the Landmark edition, and Paradeisopoulos 2024 argue for an identification of the modern Afrin, ancient Oinoparas (making the villages of Parysatis around Afrin the town), but this simply does not align with Xenophon's measurements unless Myriandos is much further south. Unfortunately, this segment is just the beginning of another infamously ambiguous section of the text, so working backwards is difficult. This reconstructed segment aligns with Xenophon's measurements well, placing the villages of Parysatis north of Aleppo.

(1.4.10) Chalus river(?) to the Dardas river(?):

- This segment is a significant part of why this segment is so contested in scholarship, though it often goes unacknowledged. Most scholars focus on the ambiguous location of Thapsacus, which is certainly an important contributor to the ambiguity, but Xenophon's measurements here are very unwieldy. They also do not fit the standard 5 parasangs/day rate, but even if they did it would still be a stretch. The only way it would not would be if they were suddenly half their expected value, which some scholars have suggested in Babylon and when the army is hypothesized to be off roads, but Xenophon gives no explicit indication of this, especially not at this time. The Dardas is an extremely ambiguous river, its sources moreso, and in a region where rivers are exceptionally prone to shifting course over the millenia, as has happened with even the Tigris and Euphrates. The relative reasonability of the preceding and proceeding segments, even with their ambiguities, causes this one to further stand out.
- This reconstruction places the endpoint (and thus the palace of Belesys) a bit north of the Pleiades reference point for the Dardas (which is well within the very indeterminate point's margin of error) at the sources of many tributaries which eventually flow into Lake Jabbul and the Euphrates. This is the generally agreed upon area of the Dardas, plus or

minus about 60 kilometers, but any finer granularity is difficult. This is in rough accordance with the route to Thapsacus if it is identified with Seleucia-on-the-Euphrates, more commonly Zeugma, a traditional but not unilateral choice, and does not cause them to march along the Euphrates, something the Greek does not imply (but could be contrived to possibly mean). This reconstruction causes this segment alone to be isolated in heavy distortion, preserving the relative reasonability of the preceding and proceeding segments. It only covers about a third of Xenophon's stated distance (Xenophon states 5 stages/30 parasangs = ~162 km, this covers 53.91km or about 10 parasangs).

(1.4.11) Dardas river(?) to Thapsacus(?):

- The location of Thapsacus has been a hotly debated topic for well over a century at this point, and perhaps one even in antiquity. This reconstruction opts for an identification of Thapsacus with Seleucia-on-the-Euphrates, Seleucia-in-Zeugma, or colloquially just Zeugma. Gawlikowski 1996 argues for this as the site of a major crossing, but more importantly argues against any crossing near or below the bend in the Euphrates (such as those adopted by the Landmark editors or by Paradeisopoulos 2024) on the grounds that those routes only gained prominence much later in history and environmental factors (water availability, supplies, safety, terrain, Euphrates stream velocity) make it a significantly more challenging and unlikely route and crossing. These conclusions and this argument have been supported—though by their own admittance not proven—by Comfort et al. 2000, 2001, the field archaeologists in charge of excavations at Zeugma and surrounding areas prior to their flooding by the Birecik reservoir in 2000. Comfort et al 2000 further elaborates on the water and supplies problem of any route crossing at the bend, because the area below the 200mm isohyet line (the minimum annual rainfall necessary for rain-fed agriculture) lies about 60km below Zeugma (p. 111)
- Opponents to a northward crossing (cf. Landmark, Paradeisopoulos 2024 p. 9) have cited that Xenophon's individual segment measurements do not correspond to the actual terrain as well as they do for a bend crossing. However, these arguments do not adequately account for the practicality of a Euphrates-bend crossing, the Greek words' implication that they only see the Euphrates at Thapsacus where to reach the bend they would have to march along it for quite some distance, and evidence from Arrian on Alexander's same passing and his bringing warships overland from the Mediterranean to Thapsacus (see Gawlikowski 1996). Furthermore, due to having less terrain to work with, they significantly shorten the value of a parasang (sometimes by half or greater) in the subsequent route through Babylonia without sufficient explanation, something a northward crossing does suffer as heavily from.
- While identification of Thapsacus with Zeugma is well-argued, it is not the only possibility for a northward crossing. Carcemish, about 30km southeast of Zeugma, is another popular northward identification. However, its location on the Turkish-Syrian border has made investigation and excavation of the site challenging. Due to the abundance of scholarship and analysis on Zeugma as Thapsacus, this reconstruction has chosen this identification, though it acknowledges that other northward crossing sites (such as Carcemish) are possible.

(1.4.19) Thapsacus(?) to Araxes river(?):

- The identification of Xenophon's Araxes hinges on whether one believes a northerly route, as reconstructed here, or a crossing near the Euphrates bend. Those who argue for an identification of Thapsacus around the Euphrates' bend reconstruct a straightforward march along the Euphrates to where Xenophon's Araxes, usually identified as the Khabur or one of its offshoots, flows into it. They argue that the length of these measurements are meant to account for the supposedly difficult terrain in this region, for the distance between their Thapsacus and the Khabur is too short.
- However, these distances line up very well when reconstructing a northern crossing, where Xenophon's Araxes is identified with the Balikh. This reconstruction involves a march to the headwaters of the Balikh, then a march along it down to where it meets the Euphrates. It is worth noting that Xenophon does not indicate any challenges with the terrain in this segment—rather, the villages they found were bountiful with supplies—nor anything that would even suggest a change in the parasang's value as he does in later ones. The terrain here is significantly better watered than a southerly route, much more capable of provisioning an army. Furthermore, Xenophon does not state that they marched along the Euphrates for this segment, as he explicitly states in the proceeding one (1.5.1). Finally, a crossing at the headwaters of the Balikh would be significantly easier than where it meets the Euphrates. All of this provides a very compelling argument for reconstructing a northerly route, and is much better supported by Xenophon's words.

(1.5.1) Araxes river(?) to Corsote(?):

- The Mascas and Corsote are both highly ambiguous sites, and both are dependent on the reconstructionist's view on Thapsacus (see the discussion on segments 1.4.10, 1.4.11, 1.4.19). This reconstruction identifies the Thapsacus with the Khabur, a traditional and prominent, though not unilateral, choice. Xenophon describes Corsote as surrounded by the Mascas, but the rivers in this region are so prone to shifting that this description is unreliable. The reconstructed distance aligns with Xenophon's measurements, though falls close to the low end of the margin of error. This could be due to the difficult terrain which Xenophon describes.

(1.5.5) Corsote(?) to Pylae(?)

- Xenophon gives the nonstandard measurement of 13 stages/90 parasangs (~486 km), an incredibly long distance for a segment, indeed the longest he gives in the whole *Anabasis*. He does describe Cyrus making some stages especially long in order to reach water and fresh grazing land, which may account for why the parasang count is exceptionally higher than the expected 5 parasangs/day rate.
- There is a general consensus (see Reade 2015, Landmark, Paradeisopoulos 2023 and references) that Pylae is somewhere between Hit and Ramadi, with a slightly more specific, but still generalized, area around modern Albu Nimr suggested due to its location where the Euphrates transitions from a valley to an alluvial plain (Pylae/Pylai meaning "gates", and "gates" in this sense being this transition from harsh desert to

more fertile alluvial plain; see Reade 2015 p. 177 and Landmark p. 26 n. 1.5.5c). This location is adopted by this reconstruction. This distance actually works surprisingly well with the identification of Corsote at the junction of the Khabur and the Euphrates without the need to explain away a significant shortening in the value of a parasang. It is within the margin of error, though closer to the lower end (expected = 486km, reconstructed = 445.44km, low margin = 423km). This must be due to the difficult terrain, for Xenophon describes the land as “absolutely bare”. It is significantly easier to believe the harsh terrain would lower the parasang value from 5.4 km/parasang closer to 4.7 km/parasang rather than a value like 3.15 km/parasang or lower, as some have suggested (Paradeisopoulos 2023 p. 11).

(1.5.10) Charmande?

- This city is mentioned by Xenophon as having been visited sometime during the course of the march described in the previous segment, lying on the opposite side of the Euphrates. Some soldiers visited it with rafts for supplies, and Xenophon mentions it to contextualize a dispute between some of Clearchus' and Menon's troops.
 - Due to its incredibly cursory mention, lack of any relative distances, and lack of surviving archaeological or historiographic evidence, this incredibly ambiguous site has gone unlocated. Some have suggested it to be near Jubbah or Hit, but really any site on the opposite side of the Euphrates during the previous segment has potential to be the city. Since it does not directly impact the route, this reconstruction has left it unlocated.

(1.7.1) Pylae(?) to 1.7.1 stopping point(?):

- Xenophon's measurements do not match the standard parasang rate, but this route is relatively straightforward. Despite not explicitly stating so, this segment most certainly continues to follow the Euphrates.

(1.7.14) 1.7.1 stopping point(?) to 1.7.14 stopping point(?):

- The reason this does not follow the standard parasang rate is most certainly due to the troops marching in full battle formation wearing equipment and due to the defensive ditch that created a very tight bottleneck that they had to pass through, likely near modern Saqlawiyah.

(1.7.19) 1.7.14 stopping point(?) to 1.7.19 stopping point(?):

- This segment is mentioned almost in passing by Xenophon to illustrate the broader point that Cyrus thought Artaxerxes was not going to attack him soon, hence why there are no measurements or much description given. This makes the exact distance and direction ambiguous, though it's likely they were still following the Euphrates. According to the methodology of this study, this segment has been reconstructed at the standard 5 parasangs/day rate, though it is entirely possible that it was closer to 4 parasangs, as some other scholars have suggested. Cunaxa is not precisely identified however, and 5 parasangs does not contradict the text nor terrain, so this reconstruction stands.

1.7.19 stopping point(?) to 1.7.20 stopping point(?)

- This is the final march before the famous Battle of Cunaxa. Cunaxa itself is not a well identified location, and indeed Cunaxa isn't even mentioned by Xenophon at all; that detail comes from Plutarch, though there is evidence he was relying on earlier sources potentially contemporary to Xenophon. Due to lack of decisive archaeological evidence, some scholars turned to linguistic arguments, suggesting a number of sites, but these likewise have flaws. The general consensus is that the battlefield lay south of modern Fallujah, north of Babylon, and closer to the Euphrates than the Tigris. Xenophon notes that the distances from the battlefield to Babylon was "said to be" 360 stadia (~6.6km) (2.2.6), but this cannot be reconciled with his measurements given in Book 1. The Landmark editors place it south of ancient Sippar, which this reconstruction agrees with.
- Xenophon's measurements for this march are also ambiguous. In 1.7.20, when the march is first mentioned, Xenophon does not give any measurements, only stating that Cyrus rode his chariot the day after the previous march. However, in 1.10.1, on describing the retreat of Ariaeus after the death of Cyrus, he notes that Ariaeus' troops retreated from Cyrus' camp near the battlefield to their previous stopping point the day before, which "was said to be" 4 parasangs away. 4 parasangs corresponds to the distances he gives in 1.7.1 when describing the march to Babylon, but the reason for his uncertain tone here is uncertain. However, since Xenophon notes 4 parasangs here explicitly, and since that does have some justification from 1.7.1 (and potentially 1.7.19), it has been used here as opposed to the 5 parasangs/day standard.
 - The spatial narrative of Xenophon's description of the battle is also important, but due to its more narrative focus and ambiguous placement this research's GIS methodology is not suitable to reconstruct it. Instead, see the Landmark's Diagram 1.8 and Appendix L.

Book 2

(2.2.8) 1.7.20 stopping point(?) to 1.7.19 stopping point(?):

- This segment details the Greeks traveling through the night from the battlefield to join up with Ariaeus (2.2.8), who had retreated from the battlefield to their previous stopping point that was about 4 parasangs away (1.10.1).

(2.2.13) 1.7.19 stopping point(?) to Babylonian villages(?):

- This segment is one of few where Xenophon gives direction but not distance, noting that they began the march with the sun to their right (ie. northward). Assuming the standard rate of 5 parasangs/day, they would have encamped about 10km northwest of modern Abu Ghraib.

(2.3.10) Babylonian villages(?) to provisioning villages(?):

- This segment is assumed to be a day's march, for Xenophon does not indicate a rest or nightfall, but he likewise does not give any direction or distance information, only noting that the army had to cross a number of channels and improvise bridges across them. Reade 2015, building on previous work, argues for a number of reasons that villages were north of modern Aqar Quf. This agrees with the reconstruction thus far,

Xenophon's narrative, and the standard 5 parasangs/day rate, so this proposal has been adopted.

(2.4.12) Provisioning villages(?) to the Wall of Media(?):

- This segment's reconstruction is contingent on the common scholarly interpretation that Xenophon accidentally mixed up the order of Sittace and Opis in the text (see proceeding segment on 2.4.13). Xenophon only gives stages for this segment, no parasangs. While normally this would entail a reconstruction at the standard rate of 5 parasangs/day, there is very good reason to make this an exception. Primarily, Xenophon's description of the Wall of Media matches near perfectly with the archaeological remains at Habl al-Sakhr, north of modern Mahmoudiya, identified as a portion of the famed defensive wall built by Nebuchadnezzar. While it is uncertain exactly what shape and course this wall took, it is known to have stretched to Opis and had a road following its interior. Since only a portion of the wall survives, it is similarly uncertain where exactly the gate Xenophon entered, but the site of Habl al-Sakhr perfectly lines up with the eight parasangs Xenophon proceeds to give in 2.4.13, though as mentioned above this follows the assumption that Xenophon mixed up the names of Sittace and Opis.
- As reconstructed, the route is about 47.42km, or about 8.7 parasangs, meaning they traveled just under 3 parasangs per day. This interpretation is not unfounded, as Xenophon curiously does not give any parasangs, but the reason for this slow procession is unknown. It could be due to the suspicion between the Greeks and their Persian guides, a deliberately circuitous route, or some other obstacle Xenophon does not mention.

(2.4.13) Wall of Media(?) to Xenophon's Sittace [Opis]:

- This reconstruction follows the interpretation that Xenophon reversed the names of Opis and Sittace, recording that they marched through Sittace first and then Opis, when in actuality it was first Opis, then Sittace. This is a common scholarly interpretation based on the most recent archaeological evidence (see Reade 2015, Landmark edition), though not a unilateral one (cf. Paradeisopoulos 2023). The reason why this is not so ubiquitous is because, while Opis has a relatively solid identification at least to a specific area, Sittace is more uncertain; furthermore, the Tigris is known to have shifted course over the millenia, but retracing its course during Xenophon's time with any certainty is an excruciating, nigh-impossible task. Reconstructing this is unfortunately a "lose-lose" scenario for one trying to take Xenophon as close to face-value as possible, though far from the only one like it in the Anabasis. One either assumes Xenophon reversed the order, which is contradictory to the text, or one reconstructs a point for Sittace that is far too close to Opis, thereby implicitly saying Xenophon's measurements are wrong and still contradictory to the text. If one fully disregards the archaeological and historical data, then that is a full departure from the purpose of this study and tantamount to just drawing lines on paper. However, in looking at the distances Xenophon gives, the terrain he describes near the cities (eg. the Tigris River crossing, the Physkos river), and the

surrounding archaeological and historical evidence, this reconstruction seems best for following Xenophon's spatial narrative.

(2.4.25) Xenophon's Sittace [Opis] to Xenophon's Opis(?) [Sittace]:

- This reconstruction follows the interpretation that Xenophon reversed the names of Opis and Sittace (see preceding segment 2.4.13). This distance lines up very well with Xenophon's measurements, further supporting this interpretation. The Physcus River, in this reconstruction, would be the modern Radani. They would have had to cross the modern Diyala River, which Xenophon does not mention. However, like the Tigris, the Diyala is known to have shifted course, and Opis is generally considered to be near a confluence of the Tigris and Diyala. It could be that the crossing of the Diyala was implicit in Xenophon's account of crossing the Tigris, or that it was further downstream, or that its height was not noteworthy enough to record.

(2.4.27) Xenophon's Opis(?) [Sittace] to villages of Parysatis(?):

- This reconstruction lines up remarkably well with the measurements and terrain Xenophon gives, further supporting the identification and reconstruction made in 2.4.25. Xenophon explicitly notes that they traveled through desert terrain, making it unlikely they strictly followed the banks of the Tigris, and this aligns with the stretch of land between the Radani/Adhaim river (Xenophon's Physcus) and the Little Zab (unmentioned by Xenophon). This reconstruction locates the villages of Parysatis west of modern Al Hawiga, on the banks of the Little Zab. While the villages are unidentified, there is ample archaeological evidence for settlements in this area. This also lines up perfectly with the next segment, where Caenae (ancient Assur) is at the end of a day's travel, just as Xenophon notes.
- All scholars agree that Xenophon must have crossed the Little Zab on the route and omitted mention of it, though they disagree on the importance of that omission. This reconstruction agrees that the omission was due to unimportance, as at the time the Greeks were crossing the river, its water levels must have been low enough to be unremarkable. It could be that Xenophon intended it to be implicit with the mention of the villages of Parysatis, and he expected his audience to know that villages would be located near a stream.
- Xenophon records that their march this segment is through Media, but it's unclear what precisely his conception of Media was. All of this land was ruled by the Achaemenids, as evidenced by the villages belonging to Parysatis, though in previous centuries this land certainly belonged to the Medes. It could be that Xenophon considered much of the land east of the Tigris, though the Zagros mountains, to be Media. Ctesias, a Persian contemporary to Xenophon, mentions resettlement efforts at Nineveh by Medes around 400 BCE—a place Xenophon visits in Book 3 and at this exact time. However, this should not be given undue weight, as the reliability of Ctesias as a source is infamously shoddy.

(2.4.28) Villages of Parysatis(?) to Zapatas River crossing(?):

- This reconstruction works perfectly with Xenophon's measurements, terrain descriptions, and previous segments. While some scholars have argued they went further upstream the Zapatas in order to cross, this reconstruction shows that a path all along the banks of the Tigris, just as Xenophon states, is what fits best.

Book 3

Zapatas river to 3.3.11 villages(?):

- Xenophon reports they traveled "not more than" 25 stadia due to being harried, so could be anywhere within this radius

3.3.11 villages(?) to Larisa:

- No measurements given, except that at some point they crossed a gorge, had a scuffle with the Persians at 8 stadia beyond it, then finished out the day unaccosted. Should be able to march further than this though, but the skirmish may have taken time

Larisa to Mespila:

- The distance lines up perfectly with the range of values given. The only problem is that the Mespila reference point is on the opposite side of the Tigris, and they haven't crossed yet (made the mistake of mapping it like they had before)

Mespila to 3.4.18 villages(?):

- No direction given; assuming they followed the Tigris

3.4.18 villages(?) to 3.4.19 stopping point(?):

- No direction, destination, or distance measurements given. Assuming they followed the Tigris still. A day's march at 27km seems excessive for this region, even though it lines up (or in some cases is even smaller) than typical historical figures .

3.4.19 stopping point(?) to 3.4.23 stopping point(?):

- No direction or much elaboration given. They actually proceed five stages, but the action picks up midway through their fifth stage, so I made it a separate segment
- 4 stages at ~30km a stage seems extremely excessive for this region, because if they traveled 120km they'd be right in the middle of Karduchoi here. Even with a windy path and mountainous terrain, there's only so much that can be done
- There's also no mention of them crossing or even encountering the Little Khabur that flows into the Tigris. They could've gone around it, but that doesn't explain why Xenophon didn't mention it

- Also the action cuts back in the middle of the fifth stage near a mountain crossing, though it is unclear what this refers to. There's more mountains here than Xenophon seems to have recognized
 - At first glance, and with the distances still to go, it would seem to be the range just south of the Khabur Tigris that pulls in close to the Tigris river, then they stomp around that river valley north for a bit before resolving to go into the Carduchian mountains
 - There's a path further north, but it's basically at the entrance to the Carduchian mountains, so that seems like it'd be later, even though it's closer to the measurement distance Xenophon gives here
- This is a scenario where 'face-value' has no clear solution, as one has to either side with Xenophon's narrative or descriptive geography or his measurements. In this case, it is reconstructed according to his descriptive geography, resulting in an endpoint well within the reconstructed radius

3.4.23 stopping point(?) to 3.4.24 palace and villages(?):

- This also again seems exceptionally long. They did skirmish with the Persians here, but it doesn't seem like it was enough to slow their progress.
- Still, given the skirmish, hill terrain, and need for more space, they were reconstructed slightly within the radius of a conservative estimate of day's travel
- Also Xenophon reports for their next leg the descend into the plain, so for this specific endpoint they were placed further up the mountain

3.4.24 palace and villages(?) to 3.4.32 village(?):

- No measurements given. Xenophon reports that they were overtaken and forced to encamp after descending into the plains. This radius was created for 1/4th of a day's travel, which is a reasonable narrative assumption and more importantly lines up well with the terrain.

3.4.32 village(?) to 3.4.37 stopping point(?):

- This measurement (60 stadia) lines up decently with how the previous is plotted, and is about the exact distance to the Tigris, assuming not a straight line

3.4.37 stopping point(?) to 3.4.37 stopping point two(?):

- Little long, but with a winding path and given the terrain, it is not as bad as it could be.
- Where Tigris becomes impassible is up for debate. I took a look at the 3D local render and it seems that, minus a few exceptions, the cliffs beside the Tigris are not completely sheer until this point. It would have been a difficult journey, but possible. After this point, however, there is no plain on the eastern bank that is walkable; the cliffs are sheer
- They also have a battle here over a summit, hills/piedmont that protrude from the mountains. This seems like it could be in this area, though a lot of terrain south of Karduchoi could match this
- When describing geography, Xenophon keeps talking about how villages occupy and roads descend into "the plain" (3.5.1). I checked the Greek, and it seems that this might

be a misleading translation. It's not the plains of Mesopotamia, but the floodplain/shores directly on the banks of the Tigris.

- It seems there is enough area here to support at least a village or two, as he describes, but further east, not as far following the Tigris, would line up better.

Book 4

3.5.13 villages(?) to 4.1.5 mountain(?):

- There's no measurements or timeframe given beyond they left after the night's "last watch" and arrived "at daybreak" (4.1.5). Given that, this reconstruction opted not to use a radius and simply reconstruct them along the quickest path to the mountain pass

4.1.5 stopping point(?) to 4.1.11 villages(?):

- Inside radius. They traveled at a slow pace, and Xenophon reports it took the whole day to ascend and descend the mountain. Looked at the 3D map, followed a pass, and mapped until they descended the mountain

4.1.11 villages(?) to 4.1.14 stopping point(?):

- Inside the radius, but the measurement of the specific route is almost exactly a full day's march. Followed terrain for easiest logical path. Intentionally stopped short of full distance because Xenophon said they rested and fought a bit throughout.

4.1.14 stopping point(?) to 4.2.4 stopping point(?):

- Extremely tedious section. No clear measurements, a day's travel is only implied, and the terrain descriptions are constantly broken up by descriptions of battles and tactics. Given distances, possible routes, terrain descriptions, and the severe storm and skirmishes they're said to endure, they are reconstructed within the radius.

4.2.4 stopping point(?) to 4.2.22 houses(?):

- They fought a battle for mountain passes this whole day
- There's zero indication of where they traveled or how far, but it since they stopped after the battle in the Carduchians' homes, it's likely they just crossed the mountain
- The geography in this region is simultaneously detailed, vague, and very confusing, but this reconstruction's assumption regarding the mountain passes are where they stopped in the previous segment and a pass a few km east of there
 - The pass to the east is the best in the area that matches Xenophon's descriptions of hills, seemingly being easy enough for baggage animals to traverse, while still making sense with his journey as plotted

4.2.22 houses(?) to 4.3.1 villages(?):

- Relatively flat terrain, though not perfectly so. Also, they were consistently slowed by Carduchians, so that would affect progress. Still relatively close to radius. This reconstruction places them on hills above Centrites because of terrain description

- Next section talks about a particular ford to cross the Centrites with precise measurements (4 stadia= $\sim$ 840m). After measuring a bunch of different angles to and across the river, the most likely interpretation is 4 stadia from their village, so I put the stopping point for this segment where that measurement would fit.

4.3.1 villages(?) to 4.4.2 village(?):

- 5 parasangs seems a bit long since that's a full day's march and they say they only started at midday, but still plausible
- Xenophon describes terrain as flat and pleasant, so that could help with their speed. Terrain doesn't actually look that flat, though compared to Karduchoi it certainly is
- Some scholars argue they go north after their crossing, but that doesn't seem as likely to me due to how Xenophon describes terrain
 - The closest flat and level terrain is to their west, so that is where they have been reconstructed
- Can't find any archaeological sites identified with the palace of the satrap Xenophon mentions, but their stated measurements puts them between modern-day Kayabağlar and Kurtalan

4.4.2 villages(?) to "Tigris headwaters"(?)

- Physically impossible for them to hit what is, by modern day standards, the actual Tigris headwaters (Lake Harpazus)
 - However, there are many rivers and streams that empty into the Tigris in this region (Mansur Creek, Yanarsu Stream, Kulp Çay, Batman Çay, etc.) that are likely what Xenophon collectively labels as "Tigris headwaters"

"Tigris headwaters"(?) to 4.4.3 Teleboas villages(?)

- There are only two routes through this section of the anti-Taurus/Zagros mountain range:
 - **1) Up the Kulp Çay:** This pass is preferred for this reconstruction. They would follow the Kulp Çay through most of the mountains, breaking away from it at a bend, then exiting the mountain range southwest of the Teleboas (Karasu) and modern-day Muş
 - Cons:
 - Xenophon does not explicitly say they follow the "Tigris headwaters" up-stream
 - The actual path overshoots their stated measurements (15 parasangs, $\sim$ 81km) by about 10km, though more liberal estimates of a parasang shorten, but don't eliminate, this gap
 - It's debatable if there was a road here (however, there's no good archaeological record of routes anywhere in this region)
 - **2) Roman Road/Modern Baykan:** This route posits that Xenophon took the eastern pass through the mountains, exiting near the banks of Lake Van, then following the Teleboas (Karasu) to the Muş region
 - Cons:

- Xenophon would still have to follow a river (modern Bitlis Stream), which he does not explicitly state
- Xenophon does not state he marches along the Teleboas any length, and given he describes the river as shallow, it seems there's no obstacle crossing it. Therefore, it's unclear why he would march west to Muş at all
- The distances to Muş still overshoot this reconstruction's typical estimates of a parasang (but just barely fall within range of a liberal estimate), but if he didn't march to Muş the distance is too short
- While there is evidence of a later Roman road following this pass, and there is a precedent that Roman roads were built on older routes, there's still no decisive evidence of a road here
- Teleboas is commonly considered the Karasu River, aka the Western Euphrates. However, it is physically impossible to reach that river. Scholars have argued that other scholars misidentified the Karasu River with Karasu Stream, which is in this area, and in an attempt to reconcile that identify the Teleboas as the Murat Su, which Karasu Stream flows into

Teleboas villages(?) to 4.4.7 palace and villages(?):

- Traveling 15 parasangs (81km) puts them about 8km southeast of Hınıs, about 2km northeast of modern Çatak
- From a ridge, you can just barely see the mountain pass north of Hınıs that Xenophon describes
 - The fact that it can just barely be seen actually helps the narrative, as it's only Democritus of Temnus who sees it, and Xenophon trusts him to scout ahead because he's made "accurate reports in many previous cases of the same sort" (4.4.15), implying most of the troops wouldn't have seen this
 - Also it is almost perfectly one day's march to the mountain pass from Çatak

4.4.7 palace and villages(?) to 4.5.1 stopping point(?):

- Unfortunately the evidence of caravan routes is not to a high level of granularity, so what exact pass they used through these mountains can be debated
 - However, the D-995 highway lines up almost exactly with a day's march, it generally follows the path of least resistance with elevation, and passes by a summit that matches Xenophon's description of them just crossing the summit
- Tiribazus planned to ambush them from behind by the end of the day

4.5.1 stopping point(?) to 4.5.2 "Euphrates" crossing(?):

- This segment of the route stretches the distance a bit further than 81km, though still within a liberal estimate of a parasang
- This route would have them traveling along the Araks Nehri (upper Aras) which Xenophon doesn't mention, but it is where the caravan route is said to go through

- This is probably the part of the route I'm most skeptical about because They would have to traverse a pretty narrow gorge at one point, and also potentially weave across the river a few times
- However, there is a caravan route attested to in this area, so perhaps this was doable
- Xenophon's "Euphrates" is ambiguous, and it would seem like it should be the Karasu, but his crossing it doesn't make a whole lot of sense
 - It's been floated that he misidentifies the Upper Aras as the Euphrates headwaters and crosses it, but that's over slightly more northern route, and also still doesn't line up with distance well
- Also, it's unclear why exactly the Ten Thousand would cross the Euphrates here

4.5.2 "Euphrates" crossing(?) to 4.5.5 stopping place(?):

- Original Greek says 15 parasangs, the Brownson translation uses 13 to account for slow progress on the third day. This reconstruction measured the buffer as half speed on the third day, so 67.5km or 12.5 parasangs
 - Even with this, they would still end up at modern Askale, making even less progress that third stage, since it's what lines up best with everything else and (mostly) does not extremely distort this segment
 - In making this reconstructive decision, over five completely separate areas were considered along with countless smaller nitpicking. This section of text still falls victim to the "too many parasangs" problem as noted by other scholars as a broad trend in Book 4, though not with this particular region.
 - They will also have to loop back on themselves in the segment after the next, which Xenophon doesn't explicitly say, but literally every other scholarly source thus far that in any way respects Xenophon's measurements here agrees that he has to loop back on himself at some point.
 - It is reasonable to assume that here, as with other parts of Book 4, that Xenophon could be intentionally misleading with his narrative.

4.5.5 stopping place(?) to 4.5.9 village(?):

- It's slightly under a full day's march, but only by a few km, and they do mention snow which could slow their travel
- This segment was very difficult to plot given the fact that Xenophon says no direction, gives no other measurements besides that it took a day, and to make it corroborate with a 3 day march back to the Araxes in the next segment
- As it stands, the interpretation of this reconstruction is that they perhaps thought they could take the summer road to Bayburt, but upon seeing this mountain pass [which would be directly in front of them at this stopping point] they likely turned around [also possibly had a discussion/argument about it that Xenophon omits]
- Rather than the valley of Armenian villages being between Erzurum and Askale, as scholars like Paradeisopoulos argue, this reconstruction posits that it may be near modern Bozburun

4.5.9 village(?) to 4.6.2 stopping point(?):

- This loops them roughly over the path they came in
- Once again, every route proposal I could find that in any way respects Xenophon's given parasangs have him loop, usually in this section
- Also, Xenophon doesn't even explicitly give a distance or anything for their march, he just implies 3 stages because he says on the 3rd stage Cheirisophus gets fed up and hits the guide
 - He says it's because the guide isn't leading them to any villages. To me that would seem like they're marching in terrain inhospitable to villages (ie mountains), but that doesn't line up with the geography, as they're re-marching through the Erzurum valley
 - It could be implied that he's not leading them to any new villages, which is possible, but there's really no way of knowing
- They are reconstructed as following the caravan route (also a later Roman road) partially to distinguish this backtracking from the segment when they were coming here
 - Also, skirting the mountains as reconstructed previously would push them over three stages
 - Also, this would require them to cross the Karasu again, which Xenophon of course doesn't mention (he is of no help with this segment), but they were originally reconstructed as having crossed in modern Askale because A) There is evidence it existed in that time, B) It's on the caravan route, and so C) if there was to be a bridge anywhere so that they don't have to physically ford the river, it being in a major town on a major trade route makes sense

4.6.2 stopping point(?) to "Phasis" river stopping point(?):

- One of the singular most contested lines for geographic and spatial classics in the entire Anabasis, due to a disagreement on whether they marched 7 stages to the "Phasis" or seven stages along the "Phasis" (or some combination).
- This route is slightly short of a full 7 stages (by about 20km), however it's at the base of the easiest crossing out of the Phasis anywhere close to to their ending point
 - Also, Xenophon does not give any aggregate parasangs, just a rate of 5 parasangs a day, implying 35 total. However, given the vagueness of this passage and the potential concealment/misrepresentation by Xenophon, 20km is not a serious hindrance to the possibility of this interpretation.

"Phasis" river stopping point(?) to 4.6.6 stopping point(?):

- Important to note, due to how the Greek in the next segments for "country of the Taochians/Chalybians" can be read, it is more accurate to translate it as "the area where the Taochians/Chalybians [currently] were," implying it isn't necessarily their homeland in that sense. This means, unfortunately, that everything north of the "Phasis" is even more reconstruct-ier than the rest of the text
 - That's all to say, this reconstruction is going to work as complementarily with the text and evidence as possible, but know that there are numberless other routes that could equally work with the text

- Xenophon also gives no directions or real reasoning for these next couple segments, but it's likely the Ten Thousand are a combination of lost/starving to death and making detours for supplies
- Actually slightly within the radius, though only by about 6km, still within a conservative parasang estimate
- This is right at the foot of a mountain pass about 11km/60 stadia long, matching Xenophon's accounts. It also doesn't appear steep enough to prevent the pasturing of animals, also corroborating Xenophon's description
- It doesn't directly lead into the "country of the Taochians" after, but it's only ~20km off from the mountains that confidently contained the Tao region, and it's important to remember the imprecise Greek mentioned above and that geographic boundaries are not hard lines

4.6.6 stopping point(?) to 4.6.27 villages(?):

- No measurements given in this section; Xenophon only mentions that they fight with enemy forces for the pass, then cross to the other side, where they encounter villages
- Given this, this study reconstructs them through the pass and put a stopping point on the other side, no more (about 6km southeast of Sarikamish)

4.6.27 villages(?) to 4.7.2 stronghold(?)

- The way Xenophon writes his narrative makes it sound like the stronghold incident is at the end of this segment, but it seems possible that it could've happened at any point in the journey when they encountered a stronghold
- The best non-writing style reason I can think of is that taking a stronghold would've been troublesome, so they left it until they absolutely had to, i.e. where the segment ends
- Regardless, this reconstruction posits they went near Tortum since it fit best with their distance while having remnants of a big castle
 - It's not certain when the foundations of this castle were built, however the nearby city of Oltu (also mapped through earlier in the segment) has a castle whose foundations likely date to Ururian times (<https://www.castles.nl/oltu-castle>)
- Xenophon gives a distance of 30 parasangs over the course of 5 stages, which is 5 parasangs over his normal speed of 5 parasangs per day/stage
 - No reasoning is given for this inconsistency
 - These few segments of the text are off with no given reason, contributing to the age-old mystery of what is up with Book 4
 - This is also contributing evidence that Xenophon may intentionally be concealing something in this section, the Ten Thousand are lost, both, or some other metatextual reasoning for this inconsistency
- The reconstructed distance is slightly over a liberal estimate of a parasang by ~6km, but due to the already heavy textual inconsistencies and heavily reconstructed nature of this section, this error is acceptable.

4.1.14 stopping point(?) to 4.7.15 stopping point(?)

- One of the most challenging segments in all of the Anabasis
- Firstly, 7 stages should only be able to accompany 35 parasangs, not 50

- Once again, no reasoning given for this inconsistency
- Just by looking at the text, no map necessary, we can see that something is up. Either Xenophon means a different value for a parasang and doesn't clarify, he for some reason misremembered or intentionally misattributed the parasang or days traveled values, etc.
- The region of the Chalybians is already so vague since Chalybian is a generic Greek-imposed ethnonym on the diverse peoples of the Black Sea coast
 - It is typically used for the more westward Pontus region, for which Xenophon uses the label 'Chalybian' again in Book 5, which leads some scholars to believe he should've actually said the Chaldians
 - However, even if Xenophon did use 'Chaldian', it is subject to the exact same problems as the term 'Chalybian.' It likely refers to descendents of the Urartu civilization, but even that is so broad-ranging, poorly understood, and up for debate
 - Furthermore, the Greek in these sections implies that it may not be the "country of the Chalybians" in a homeland sense, but simply where the Chalybians are located physically at this point, ie. like an occupying military force.
 - This "country of the Chalybians" aligns more with the historical Tao region, like for the Taochians. Xenophon describes them similarly and, given the reasons above, may not have cared to make an accurate differentiation, but still something to keep in mind
- Regardless, 50 parasangs equates to ~270km, which this region absolutely cannot reasonably accommodate
 - They are bounded by the Oltu river to the north, which they do not mention crossing or even encountering
 - Furthermore, even if they did cross the Oltu, there is functionally nowhere for them to go north that doesn't get dead-ended, causing them to have to circle back, and it's unclear why they would randomly circle back in the middle of the mountains
 - Plus, they would likely encounter the Harpasos (Choruh) and travel along it way longer than is stated.
- This study did not reconstruct them going through every single dead-end valley then retracing their steps. If it did, it would definitely add some kilometers on to get closer to their stated distance, but it would still be hard-pressed to reach 270km, and additionally it would make the map very visually confusing, cluttered, and hard to interpret.
- Because of the extremely challenging measurement given in this segment, this interpretation made the difficult decision to worry more about preserving the distances in proceeding and surrounding segments than in this one, meaning this segment is highly misleading distance-wise from what Xenophon reports, though makes sense narratively.
- This reconstruction maps them to the Choruh river at a point more consistent with the following segments (near modern Irmakyan), but it is worth noting that it may gorge too narrowly to traverse. It may not be impossible, and we do not know the ancient routes of this area, but it is important to keep in mind.

4.7.15 stopping point(?) to 4.7.18 villages(?)

- Literally cannot find anything on the Scythians. Likely an offshoot/related to the Scythians, but very difficult to tell
- With mountainous regions, a lot of these small ethnic groups are relegated to specific valleys and change considerably over time.
- Xenophon specifically mentions encountering villages, presumably non-stronghold ones like previously
 - The area of Ispir and northeast of it has the most space in the area to actually accommodate any villages, so if there were some I'm betting they're there
 - Also, the Choruh gorges extremely narrowly at multiple points, and so, given the alternative, I was inclined to not map them directly beside the river because of this traversability issue
 - However they would be going through very difficult, mountainous terrain, so this reconstruction is not without problems
- This area does not map on perfectly to Xenophon's measurements. It's possible the very difficult terrain is to blame for part of it, though even with that 20 parasangs still stretches possibility for this region
- However, I mapped it this way as a compromise with the next segment, since 40 parasangs over two segments to Gymnias stretches plausibility for this area

4.7.18 villages(?) to Gymnias

- Working with the assumption that Gymnias is Bayburt. Subject to some notable academic debate (see Paradeisopoulos 2013, 2023)
- Lines up pretty close to stated distance, if a bit short, but still within range. Keep in mind that previous two segments were short as well, however, partially as a compromise for this segment to work

Gymnias to Mt. Theches:

- See Brennan and Tuplin (2023) for a good overview of different proposals for the site of Mt. Theches.
- This study opts for the Zigana Dagi proposal as Mt. Theches since it lines up best with the Ten Thousand encountering it on the 5th day and it is right alongside the path they would be traveling

Mt. Theches to Colchian boundary(?):

- The geography here is a bit confusing, and seems to once again fall victim to the 'too many parasangs to fit' plague
- Multiple scholars have floated that Xenophon cannot mean the ~5.4km per parasang rate here, but even assuming a slower rate it doesn't really line up
- His geography descriptions are simultaneously rather detailed and very vague
 - (4.8.2) He mentions a river they are presumably traveling along flowing into another river to form the boundary between the Scythians and the Colchians, but it is unclear exactly which tributary Xenophon considers the boundary and thus from which side they are traveling (see Brennan and Tuplin, 2023)

- (4.8.8) It isn't completely clear if this is a new measurement from the other one. This study is of the opinion that the three days mentioned here are meant to be the rest of day one from 4.8.2 and the next two days, as a full 6 days of travel seems strange for this region and strange that, despite encountering the Maconians on the first day, they wait two more days to guide the Greeks
 - (4.8.8-9) the boundary of the Colchians is likely a river. There are numerous mountains and rivers in this area, and evidence of a prominent boundary has yet to reveal itself
- Xenophon measurements are also odd. He records 10 parasangs over 3 days, 5 less than usual
 - If we assumed he traveled an equal distance each day, that would be ~18km
 - However, he says they reach a confluence of rivers by the first day and meet with the Macronians. The closest confluence is Machka, just over 30km away, which doesn't line up with this slowed rate. It does line up better with the more regular 27km a day rate
 - It is possible they rested for one of these days and Xenophon omits that detail
 - It is also possible that, in traveling primarily along a caravan route from Theches to Machka, they traveled at a normal rate. Then, for the next two days where they may have taken a detour to fight the Colchians at the Macronians behest (something not explicitly stated in the text, but argued by numerous scholars; see Brennan and Tuplin 2023, Paradeisopoulos 2023) their rate was slowed to ~12km a day
 - Given all of these vagaries and Xenophon's measurements in this segment and the next, this model locates the Colchian villages in the valley of modern-day Oymali

Colchian villages(?) to Trapezus:

- Locating the Colchian villages near modern Oyamli results in this segment mostly lining up, if a bit short.
- The exact pace and path taken around/over the mountains is up for debate. For clarity and to not reroute them over themselves, this model shows a slightly different re-ascent then the one in the previous segment.

Book 5

Trapezus to Cerasus:

- It is unclear by which route the Greeks traveled from Trapezus to arrive at Cerasus, as Xenophon gives no further remarks besides that they arrived on the third day of their journey, and that the roads they traveled on had been prepared by the Trapezuntians ahead of time.

- Paradeisopoulos (2013, 2023) maps a route along the coast following Trapezus. The map of the caravan routes he supplemented earlier (which are drawn from Barnett, 1982) does also seem to have a caravan route they could have followed there
- (Brennan, 2016, 2022) also supports this with his mapping of the route
- Furthermore, the Barrington Atlas Roman road data, while anachronistic, also map a road along that route
- Also, from a strictly DEM and 3D modeling perspective, the terrain does not appear to be significantly prohibitive for this route

Cerasus to 5.5.2 stopping point(?):

- Xenophon notes that the entire trip through Mossynoecian territory, both through hostile and friendly lands, was a total of 8 stages (5.5.1). This includes a route passing through the Metropolis of the Mossynoeci. This would, by the assumed parasang values, equate to 216k km. However, in a couple instances Xenophon seems to imply that they did not make much forward progress, as they camped while negotiating with the friendly Mossynoeci chiefs and waited for them to bring troops (5.4.11), and they halted after an unsuccessful attack against the citadel near Metropolis (5.4.22). Subtracting two full days, which seems plausible, would bring the route length down to 162 km.
- A Least Cost Corridor (LCC) analysis was used to assist with routing from Cerasus to Metropolis and from Metropolis to Cotyora. This output was considered in reconstruction, though not treated as ground-truth. The reconstructed route is more circuitous than the LCC would suggest, explained below.
- As reconstructed, this segment is just over 100 km. This distance falls much short of the expected 162 km. While this could be evidence for a location of Cerasus further east of Giresun, much closer to Trapezus (as argued by Paradeisopoulos 2023, Brennan and Thomas 2021), this could also be due to a number of other factors. While the Ten Thousand were being guided by the Mossynoeci, so they could not have gotten lost (the Mossynoeci could have guided them in an unnecessarily circuitous route, but there is no evidence of this). However, the terrain here, even with guides, is exceptionally difficult, with many mountains and valleys to traverse. Traversing many different mountain ridges and valleys is tacitly supported by Xenophon's description of the Mossynoecian settlement patterns and potentially whistled speech (5.4.31; see Brennan 2016 for further analysis). Additionally, perhaps another full day was spent on the siege, burning, and looting of Metropolis and the surrounding areas, though Xenophon's account of the battle is not temporally explicit. Furthermore, Xenophon notes that they looted some hostile strongholds along the way (5.4.30); it is unclear how much this would have slowed the journey, though some notable delay is expected. With these factors—the difficult terrain, the battle of Metropolis, and the further looting—it seems quite reasonable that a day's progress is lower than the standard 5 parasang a day rate, or otherwise that the value of a parasang is slower here.
 - Xenophon also notes that they encounter the Chalybians here (not to be confused with Xenophon's Chalybes of Book 4 infamy, and also potentially not to be confused with the Chalybes near the Thermodon cited by other authors of

antiquity, though this distinction is unclear). While this would constitute its own segment, as he notes they encounter them after he gives the 8 stages measurement for the Mossynoeci trek, Xenophon notes that their numbers are “few in number and subject to the Mossynoecians,” (5.5.1).

- Given this, it is likely that these Chalybes occupied a small area, perhaps even a single valley (possibly along the Melet River, southeast of modern Ordu). Given this, plus the lack of measurements Xenophon gives (unlike with the following Tibareni, which he notes took 2 days to reach Cotyora), it is reasonable that this be interpreted as the end of the entire 8 stage Mossynoecian segment.
- An even more circuitous route for this segment is contrivable from the terrain, which would reconcile the distance shortage and is certainly possible, the reasons above are reasonable enough to account for this discrepancy, and too circuitous a route would heavily contradict the LCC results, even more than this reconstruction does.

5.5.2 stopping point(?) to Cotyora:

- Xenophon notes that Cotyora is a Greek city in the country of the Tibareni, which is also noted to be much flatter than the previous segment. Given these notes, a likely barrier for the Tibareni would be the Melet River, which is supported by the previous reconstruction and topographic description.
- Xenophon notes that they proceeded 2 days until they reached Cotyora. This reconstruction hardly reaches a day's travel, which could support a more southward route in the previous segment.
- However, important to note is that the Greeks delayed somewhat because they wished to attack the Tibareni but their divination suggested otherwise, and furthermore Xenophon does not explicitly say it took 2 full days (which seems highly unlikely). These factors could account somewhat for this distance discrepancy.

Book 6

Cotyora to Harmene:

- As they sailed, no applicable commentary.

Harmene to Heracleia:

- As they sailed, no applicable commentary.

Heracleia to Calpe Harbor:

- (6.2.18) Xenophon simply remarks that Cheirisophus' troops march entirely overland, starting out through the country leaving Heracleia then marching along the coast once they hit Thrace. The problem is it's unknown where that border was, and the terrain near Heracleia is difficult to traverse through, with no clear route. Xenophon also does not give any measurements or state how long it took, making this ambiguous.

- (6.2.19) This section of the route is made ambiguous because Xenophon states that he sailed to the boundary between Heracleia and Thrace-in-Asia, but where he considered that boundary to be is unknown.
 - I have chosen to map them as disembarking on the west bank of the Sakarya River, as Xenophon does not mention crossing a river, and this one would have likely posed a major obstacle.
 - This, however, does not align with where I have plotted Cheirisophus' troops to have begun marching along the coast, despite Xenophon stating they began that when they hit Thrace as well
 - Since Xenophon did not march with them, this can be attributed to a difference in conception between Xenophon and Cheirisophus/his troops.

Calpe Harbor to Chrysopolis:

- This segment of the journey is recounted in one line with little elaboration, despite six days being a sizable trek (it is worth it to note that Xenophon says they arrived on the sixth day, but in looking at the terrain it's likely they would've spent the majority of that day marching). Xenophon notes that they spent "one day and night" travelling in the opposite direction to secure bounty ("ἐπεὶ δὲ οὐδενὶ ἐνέτυχον πορευόμενοι τὴν ὀρθὴν ὁδόν, ὥστε ἔχοντές τι εἰς τὴν φιλίαν ἐλθεῖν, ἔδοξεν αὐτοῖς τοῦμπαλιν ὑποστρέψαντας ἐλθεῖν μίαν ἡμέραν καὶ νύκτα"). It is ambiguous as to whether they traveled a whole day and night (which given the time is highly unlikely), whether they spent a day and night making 'net zero progress' (which seems more likely), and where or when this detour took place.
 - Given these ambiguities, this detour has been represented near modern Teke, where by this mapping they travel south over 10 kilometers rather than north, where they likely would go to follow routes near the coast.
 - This was done so that it is visually obvious on the map that they are making a detour, even though this detour could have happened at other places along the journey. The specific distance of just over 10 kilometers is given because this 1) fits best with the travel time of the entire route segment, 2) is best accommodated by the challenging geography of the area, and 3) seems the most likely following an interpretation that Xenophon means they made 'net zero forward progress' or a similar sentiment, as spending a whole day and night marching without rest (as a more literal interpretation would follow) seems unlikely and unnecessary.

Book 7

Chrysopolis to Byzantium:

- No applicable commentary

Byzantium to Cyzicus:

- At this point in the text Xenophon had resolved to go home alone and made arrangements to sail back home with Anaxibius (7.1.38-39). Therefore, at this part Anaxibius' journey is Xenophon's own too.

Cyzicus to Parium:

- (Xenophon is still traveling with Anaxibius at this point in the text, as with the previous segment (7.2.5; Byzantine to Cyzicus).

Parium to perinthus to the army (Byzantium):

- Xenophon does not dedicate much to recounting this rather sizable portion of his journey (as it is not crucial to the story Xenophon is trying to tell), only that he sailed from Parium to Perinthus and from there rejoined the Ten Thousand (presumably still near Byzantium). This would take longer if not for Anaxibius' help who, upon discovering that Pharnabazus betrayed him, supplied sailing and horses to speed Xenophon along.
 - Despite being sizable, Anaxibius' help and the comparative developed nature of the Greek/Thracian coast means mapping this is rather straightforward.

Byzantium to Perinthus:

- Xenophon does not dedicate much to recounting this leg of this journey, other than the army marched from presumably Byzantium to Perinthus, likely following the same route Xenophon took to in the previous segment.

Perinthus to 2.3.48 stopping point(?):

- This part of the march is broken up over a couple lines (7.3.40, 7.3.44, 7.3.48).
- In order to surprise the enemy, Seuthes recommends they march through the night (Xenophon records that they begin around midnight), rested a bit near dawn, and by midday (by Xenophon's reckoning) arrived at some villages they then successfully raided.
 - Xenophon does not record what direction they were traveling, only that they were near some mountains. In looking at all the terrain a day's march from Perinthus, it appears relatively flat (especially considering the mountains they traversed in previous books), but traveling northeast from Perinthus seems the most likely since that's where the elevation has the greatest differences, there are some hills about a day's march away, and in subsequent segments of the journey Xenophon states they are north of Selymbra.

7.3.48 stopping point(?) to the Thynian plain(?)

- It's presumed they march a day, as they camp at a different spot than the previous segment. The reference point for the Thynians in Pleiades is further north than a day's march, but that's in the mountains and it's very likely their extent is far larger than Pleiades represents.
 - More evidence supporting this is that, right now in the story, Xenophon is aiding Seuthes in retaking land from other Thracian tribes, so it would make sense the

Thynians have a wider sphere of influence, so to speak. Furthermore, the Greek here (“Ἕλληνες ἐστρατοπεδεύοντο ἀνὰ τὸ Θυνῶν πεδίον”) is ambiguous in that it could simply indicate ‘the Greeks encamped upon the plain where the Thynians were’

Thynian Plain(?) to the Thracian Delta(?):

- Xenophon gives absolutely no measurement or indication of how long this segment took, meaning no distance radius can be made for this segment. He also does not give any indication of precisely where they stopped, only that it was above (possibly meaning north of, but could also indicate a higher elevation in relation to) Byzantium, and Xenophon’s self-admittedly so-called Delta of Thrace is already an ambiguous location.
 - Given the description being “above Byzantium”, Xenophon’s Delta of Thrace may be where the modern Alibey and Kâğıthane rivers join and empty into the Golden Horn, which is both north of Byzantium and its surrounding terrain is of a higher elevation.
 - Given this supposition, the reconstruction of this segment places them in the plains about 3 km north of this confluence, surrounded by steeper terrain.
 - Since Xenophon gives no time-scale for this segment, but does give a vague location, it actually grants a higher degree of freedom to this reconstruction on account of being so vague. As it is currently mapped, this segment would have taken about four days from the previously reconstructed stopping point

Thracian Delta(?) to Salmydessus:

- The length of this segment is variable given the variable nature of the previous segment, since Xenophon does not give any distance indication for either. This reconstruction is accurate to the general area, if a bit liberal with the interpretation of distance traveled, erring towards the maximum length. However, a shorter length for this segment (and consequently the previous segment) is possible. This march as reconstructed would take just under 5 (4.7) days
 - Xenophon reports they kept the Pontus on their right, but how close they traveled to the shore and whether or not they kept it in eyesight is debatable. This reconstruction opts for a coastal route, though a more inland route is possible, but it would sacrifice line-of-sight. The terrain in this region is more challenging to traverse, though not impossible and certainly not as bad as the terrain reported in previous books. The data for this terrain (ie. ESRI basemap info, Google Earth, and associated satellite data) is a little difficult to follow due to a mix of low coverage and urbanization/development (eg., the building of the Istanbul Airport shapes the terrain, and agriculture upstream effects the course/height of rivers)

Salmydessus to Selymbria:

- Xenophon says they camped above Selymbria, about 30 stadia (~5.2km) from the coast, so while there is not a radius or buffer showing that extent, this segment’s ending is

reconstructed to reflect that. Same notes on variability and time for the 7.5.1 and 7.5.12 segments apply here.

Selymbria to Lampsacus:

- Due to sailing, no applicable commentary

Lampsacus to Ophrynum:

- Xenophon reports arriving at Ophrynum the next day, however the actual distance from Lampsacus to Ophrynum is ~50 km, over a day's travel. This could potentially be explained by well-maintained roads and Spartan assistance.

Ophrynum to Antandrus:

- Xenophon does not report how long they traveled, but that they proceeded inland through Troad, scaled Mount Ida, and arrived in Antandrus. By what route they scaled Mount Ida is unclear. There is a Roman road which is said to go through here, while anachronistic, does attest to passages in later antiquity. Additionally, after examining multiple trails all across the mountain, while difficult, a passageway even for an army seems possible and thus leaves little reason to doubt Xenophon here.
- Where exactly they marched through Troad is also debatable, but this reconstruction shows them traveling south then through the valley of the modern Kucukmenderes River which, while Xenophon does not explicitly mention this river, seems very likely given the low elevation and route through Mount Ida
- As reconstructed, this segment of the journey is about 109km long and would take about 4 days

Antandrus to Thebes:

- It is unclear where along the previous segment the army halted or camped, and thus whether or not they stopped at Antandrus or simply passed by. If they did stop, then this segment took under a day (19km long)

Antandrus to Adramyttium:

- As with previous segments, no measurements or time given. This reconstructed segment is about 13km long.

Adramyttium to Certonus:

- As with previous segments, no measurements or time given. This reconstructed segment is about 35km long.

Certonus to Pergamus:

- As with previous segments, no measurements or time given. This reconstructed segment is about 22km long.

Pergamus to the tower of Asidates(?):

- Xenophon does not give an explicit indication of how far Asidates' tower was from Pergamus, only that it was in the plain and they reached it at about midnight, starting their march after dinner. To represent this, the buffer shows a march of half a day.

Tower of Asidates(?) to Carcasus river(?):

- Xenophon reports that, after the failed initial siege of Asidates' tower, the army crossed, with some difficulty, the Carcasus River. It could be implied they journeyed back to Pergamus, but Xenophon does not say that as he does in 7.8.23. Therefore, this reconstruction places them a little ways across the Carcasus river.

Caucasus river(?) to villages below Parthenium(?):

- Xenophon does not indicate how long or far the villages Asidates fled to were from where the army slept. Parthenion is tentatively located along the Ilya River, so this reconstruction ends below the reference point, near modern Aziziye.

Villages below Parthenium(?) to Pergamus:

- Xenophon explicitly references a return to Pergamus, where he does not in the previous segments. A few lines earlier he indicates he intended to march as far as possible through Lydia (7.8.20), supporting the idea that the army had equipment to encamp away from Pergamus and likely had set up somewhere.
 - Therefore, for completion's sake, it felt necessary to map this whole affair with Asidates as a unique leg of the journey rather than assuming the Ten Thousand kept marching from and returning to Pergamus, which would not be mapped.
